

INFOmobility

Online IT Consulting

Information flow and communication play a key role in the administration of enterprises in our days. No matter how big the company is, it always faces the challenge of providing access to the necessary information for its employees even when they are out of office. Mobile or remote working is getting more and more popular around the world and there is a similar tendency in Hungary. However, mobile communication of data raises a lot of security concerns, from the easy interception of data transmission or upload to potential leakout of data when the mobile equipment is lost or stolen. The value of data stored on a notebook can be much higher than the value of the notebook itself as most of the data are confidential. Letting these data reach unauthorized people is not only inconvenient for the company but can lead to legal consequences due to data integrity and classification regulations. That is why all data should be stored on a central server. INFOservices offer you a complex solution to the security problems of mobile online communication. Secure mobile or teleworking online has five fundamental conditions.

- secure communication
- central data storage
- trustful identification
- protection against viruses
- protection against attacks over the internet

The solution offered by our experts for secure communication is based on a virtual network (VPN, Virtual Private Network) with firewall. This solution offers an encrypted connection between the company's intranet and the mobile or telework station. An integrated part of a VPN connection is the creation of personalized entry key to ensure reliable identification and journalising. This key guarantees the control of user entries, and prevents the database from unauthorized access.

Flat rate Firewall / VPN service package includes:

- software expenses
- hardware lease out (optional)
- firewall planning, installing, configuring
- VPN solution planning and customising
- personal key creation
- implementing secure connection between sites
- setting up customised remote-work at workstations
- regular security updates, version tracking
- continuous event logging, log archiving
- security control
- limitless local and remote firewall management
- more secure and easier remote system operation
- hotline for remote workers
